

GitHub Copilot + Azure DevOps + Jira Cloud — Team Summary

Prepared for: robbert@floorganise.com
Date: June 9, 2026

1. GitHub Copilot for team code reviews

Recommended workflow: Copilot as a fast first reviewer; humans as the final gate.

Stage	Who	Action
1	Author	Open PR; fix Copilot findings before requesting hu
2	Copilot	Automated/on-demand review for bugs, security, st
3	Human	Architecture, business logic, trade-offs
4	CI	Build, test, lint as required checks

Encode team standards in instruction files (on GitHub): .github/copilot-instructions.md and path-specific .github/instructions/*.instructions.md.
Review effort levels (GitHub): Low for routine changes; Medium for security-sensitive or cross-service work.

2. Azure DevOps — automatic vs on-demand Copilot review

You have requested Azure DevOps on-demand Copilot Code Review (technical preview).

Approach	Automatic on every PR?	Status
ADO on-demand Copilot review	On-demand — user requests from PR UI	Preview (waitlist)
Pipeline + branch policy	Yes — runs on PR create/update	Available now
GitHub.com auto-review	Yes (org/repo settings)	Only if repos are on GitHub

- On-demand preview (what you requested):
- Inline comments in the Azure DevOps PR UI
 - No per-developer Copilot license required
 - Billed via GitHub AI credits on Azure subscription
 - Does not block merge or count as required reviewer
 - Billed from June 2, 2026 (preview pricing)

For fully automatic reviews on ADO today: Use Azure Pipelines + Build validation branch policy + a marketplace extension or custom agent (e.g. Copilot Code Review extension, Microsoft ADO Pull Request Agent).

3. Jira Cloud + MCP

Official: Atlassian Rovo MCP Server (GA early 2026) — for Jira Cloud, Confluence, Compass.

- Endpoint: `https://mcp.atlassian.com/v1/mcp/authv2`
- Auth: OAuth 2.1 (org admin can optionally allow API tokens)
- Setup (Cursor / VS Code):

```
{
  "mcpServers": {
    "Atlassian-Rovo-MCP": {
      "command": "npx",
      "args": ["-y", "mcp-remote@latest", "https://mcp.atlassian.com/v1/mcp/authv2"]
    }
  }
}
```

}

Admin checklist: Enable Rovo MCP; configure allowed AI client domains; update IP allowlists if used.

4. Jira MCP + ADO on-demand Copilot review — do they connect?

Short answer: Jira MCP is still useful, but it does not plug into ADO on-demand Copilot review today.

Layer	Jira context?	Role
ADO on-demand Copilot review	Only what's **in the PR** (title, description, diff)	Code-quality pass
Jira MCP (Rovo)	**Live** issue data	IDE/agent workflows
Azure DevOps for Jira (Marketplace)	Links PR ↔ issue in Jira UI	Traceability

Bridge them: Put Jira key + acceptance criteria in the PR description (use a PR template). On-demand Copilot reads that text; Jira MCP helps authors gather it before opening the PR.

Pipeline-based auto-review can wire ADO MCP + Jira MCP together (custom agents) — that's where MCP integration is real for ADO today.

5. Creating PRs from a laptop with Copilot

Yes — via Copilot Agent Mode + Azure DevOps MCP (VS Code or Cursor).

Flow:

- Dev commits and pushes branch
- Copilot Agent Mode + ADO MCP configured
- Prompt: e.g. "Create PR from `feature/PROJ-123-x` to `main` with Jira context"
- Dev approves MCP tool calls → PR created in ADO
- Optionally request on-demand Copilot review in PR UI

Requirements: Node.js 20+, Agent Mode, ADO MCP (@azure-devops/mcp), Azure auth, PR permissions.

Optional: Add Jira Rovo MCP alongside ADO MCP to fetch ticket title/AC when creating the PR.

Tips: Push branch before creating PR; use repo GUID if PR creation fails; branch names like feature/PROJ-123-desc.

6. Recommended team setup

Do now:

- PR template with Jira key + acceptance criteria
- Branch naming with issue keys
- Azure DevOps for Jira app (optional — visibility in Jira)
- Jira MCP for developers in VS Code/Cursor
- ADO MCP for PR creation from laptop

When ADO preview access lands:

- Request Copilot review when PR is ready (draft → open)
- Authors fix Copilot findings before human review
- Keep Jira context in PR description

Consider later:

- Pipeline auto-review with MCP-enabled agents
- Watch for Microsoft adding repo-level MCP to ADO Copilot review (GitHub already has this)

7. End-to-end workflow

Step	Who	Tool
------	-----	------

Pick up ticket	Dev	Jira
Implement + check AC	Dev	Jira MCP in IDE
Commit + push	Dev	Git
Create PR	Dev	Copilot + ADO MCP (optional)
Request Copilot review	Dev	ADO on-demand (preview)
Fix code issues	Dev	ADO PR comments
Approve design + ticket fit	Human	Jira + PR
Merge	Human	Azure DevOps

8. Slack

Slack fits the stack in three ways: notifications, Copilot agent triggers, and MCP for AI context.

Native Slack apps (recommended for team visibility)

App	Purpose
Azure Repos for Slack	PR created/updated/merged, push events, PR link pr
Azure Pipelines for Slack	Build pass/fail, deployment approvals
Azure Boards for Slack	Work item updates
Jira Cloud for Slack	Issue updates, link unfurling

Setup: install apps → /azrepos signin → /azrepos subscribe [repo URL] → tune with /azrepos subscriptions.

GitHub Copilot + Slack

The GitHub for Slack app can trigger Copilot coding agent from threads and draft GitHub issues. This is mainly for GitHub repos. With Azure Repos, Slack is for notifications; ADO PR creation stays in the IDE via ADO MCP.

Copilot also integrates with Jira and Azure Boards to trigger the coding agent from work items (GitHub-centric workflow).

Slack MCP server

Official hosted endpoint: <https://mcp.slack.com/mcp>

- Search messages, channels, files; read threads; send messages
- Works in Cursor, Claude, Perplexity (admin approval required)
- Does not connect to ADO on-demand Copilot review (IDE context only)

Slack + on-demand Copilot review workflow

1. Dev opens PR → Slack notifies channel (Azure Repos app)
2. Dev requests Copilot review in ADO
3. Dev posts “ready for human review” in Slack thread
4. Human reviewer uses Jira + ADO
